

# About CE4 Client Response Gallery

CE4 Client Response Gallery facilitates communication between the photographer and client following a photo shoot. The photographer posts a gallery of images online, and the client is able to make selects and provide feedback, sending that information to the photographer's email address for further processing.

The photographer hosts galleries on their own website, and the gallery is highly customizable, visually and behaviorally.

## System Requirements

CE4 Client Response Gallery includes a plugin for Adobe Lightroom's Web module, requiring Lightroom 3.0 or newer, for Mac or Windows.

## Hosting Requirements

CE4 Client Response Gallery outputs its galleries as PHP documents, not HTML. For this reason, CE4 Client Response Gallery should be hosted online (or in an equivalent offline environment). We recommend these hosting specifications:

- Linux OS (recommended)
- Apache server (recommended)
- PHP 5.2.6 or newer (required)

We only test on hosting meeting these specifications and cannot guarantee functionality on alternative configurations. If you require new hosting, we highly recommend [Bluehost](#) for reliable, affordable hosting of TTG websites.

Because CE4 Client Response Gallery generates PHP pages, you cannot view pages using Lightroom's "Preview In Browser" feature, nor can you run pages in the browser from your desktop.
